

Safe Redirector Flask App

This is a safe redirector Flask application that displays a preview page before redirecting. It does not impersonate other domains and is intended for safe link redirection with user confirmation.

```
# safe_redirector.py
# A minimal Flask app that shows a preview page before redirecting.
# Usage: run and visit /r/<slug> (slugs map to target URLs stored in a dict or DB)
from flask import Flask, render_template_string, redirect, url_for, abort

app = Flask(__name__)

# Example mapping – replace with a DB in production
URLS = {
    "yt-demo": "https://www.youtube.com/",
    "example": "https://example.com/"
}

PREVIEW_HTML = """
<!doctype html>
<title>Leaving {{ site_name }}</title>
<h1>You're leaving {{ site_name }}</h1>
<p>You are about to go to: <strong>{{ target }}</strong></p>
<p>Please verify that the destination looks correct. If you didn't request this, close this tab.</p>
<form method="post" action="{{ confirm_url }}">
    <button type="submit">Continue to destination</button>
</form>
<p style="font-size:0.9em; color:gray;">This page ensures redirects are transparent – we never impersonate
"""

@app.route("/r/<slug>", methods=["GET"])
def preview(slug):
    target = URLS.get(slug)
    if not target:
        abort(404)
    # Show preview asking user to confirm before redirect
    return render_template_string(
        PREVIEW_HTML,
        site_name="YourSite",
        target=target,
        confirm_url=url_for("confirm_redirect", slug=slug)
    )

@app.route("/r/<slug>/confirm", methods=["POST"])
def confirm_redirect(slug):
    target = URLS.get(slug)
    if not target:
        abort(404)
    # Optional: log the redirect, check target against allowlist, etc.
    return redirect(target, code=302)

if __name__ == "__main__":
    app.run(debug=True, port=5000)
```
